Tabman

Overview

Tabman is a lightweight productivity extension for Chrome allowing you to manage browser sessions and tab groups. With Tabman, you can:

- Save sessions that can be easily restored later
- Label sessions for better organization
- See and manage all sessions in one place

Installation

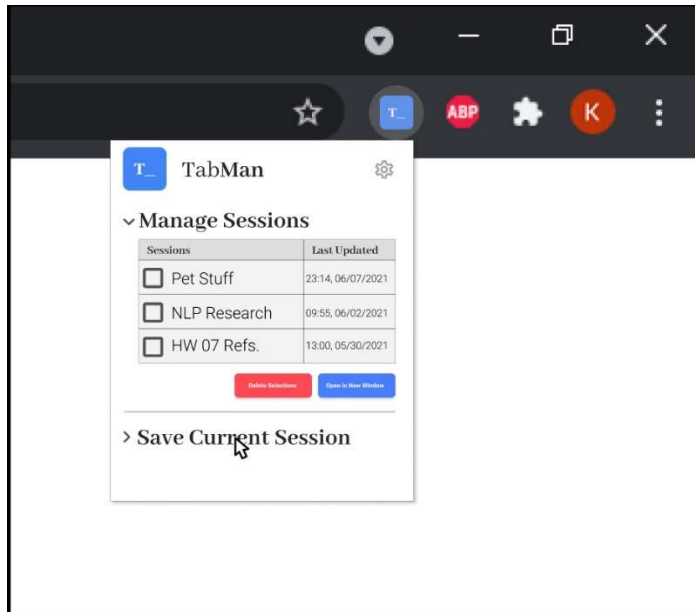

Tabman is available for download on the Chrome Web Store [here](#).

How it Works

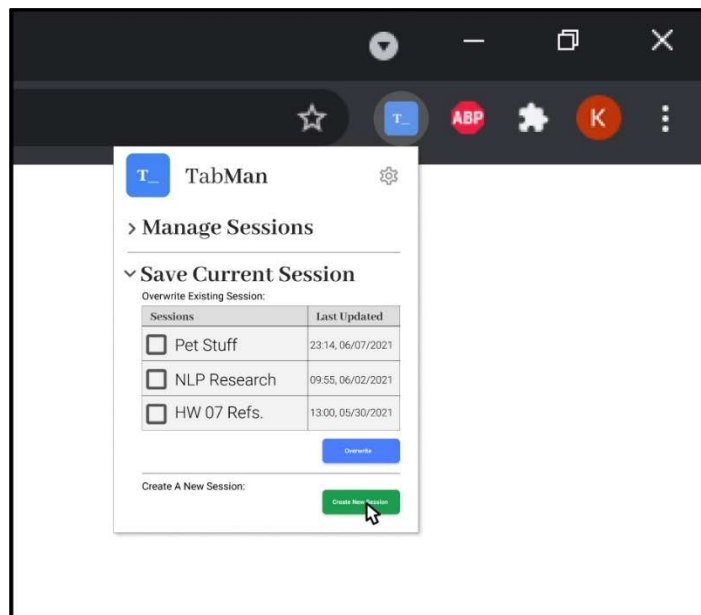

Tabman makes use of the Chrome API, which can be found [here](#). In 2020, Chrome released a new feature to create and organize tab groups. Using this feature, Tabman allows you to save and load tab groups as separate sessions, increasing organization and productivity.

Saving a Session

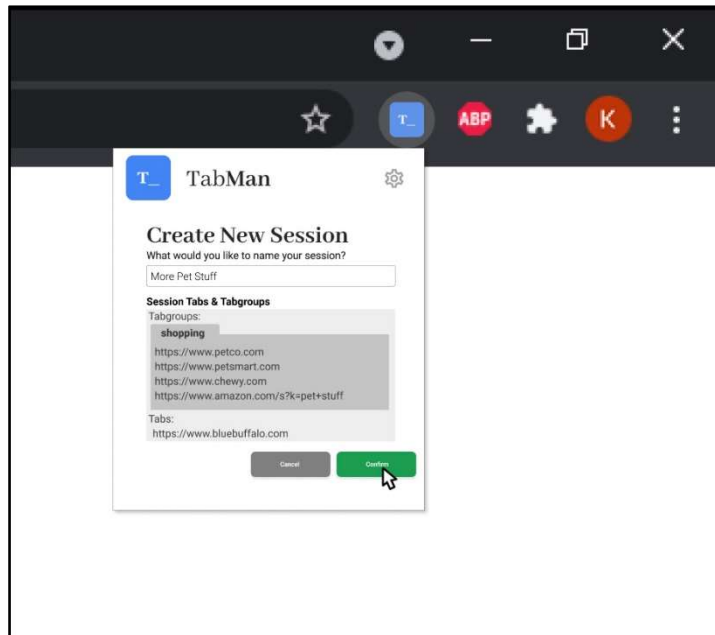

To save a session, first open all desired tabs and tab groups. Click on the Tabman logo to bring up the pop-up menu and select **Save Current Session**.

A new window will appear showing the titles of all existing sessions. Click on the green button labelled **Create New Session**.

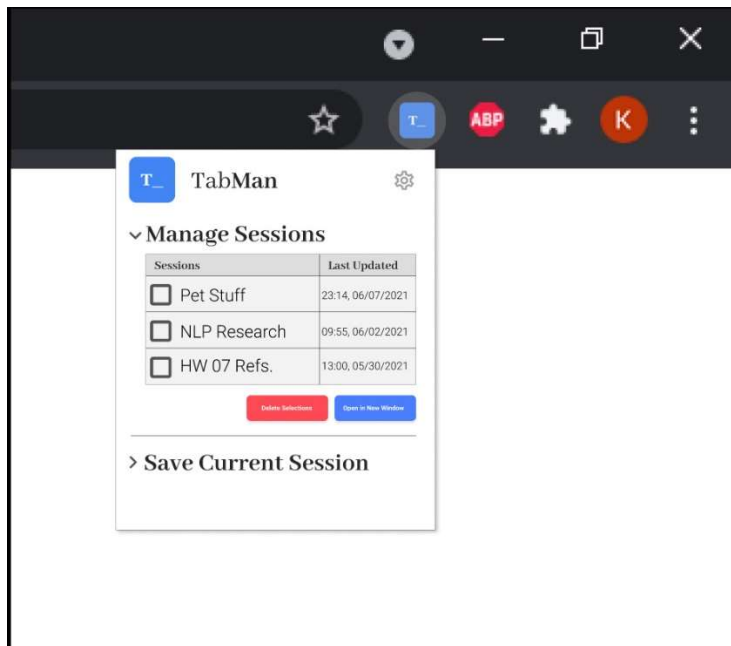

A new window will appear containing a list of all tab groups and tabs in your current session. You can name your session by clicking the textbox at the top of your tabs and typing in your desired name. When finished, click the green button labelled **Confirm**.

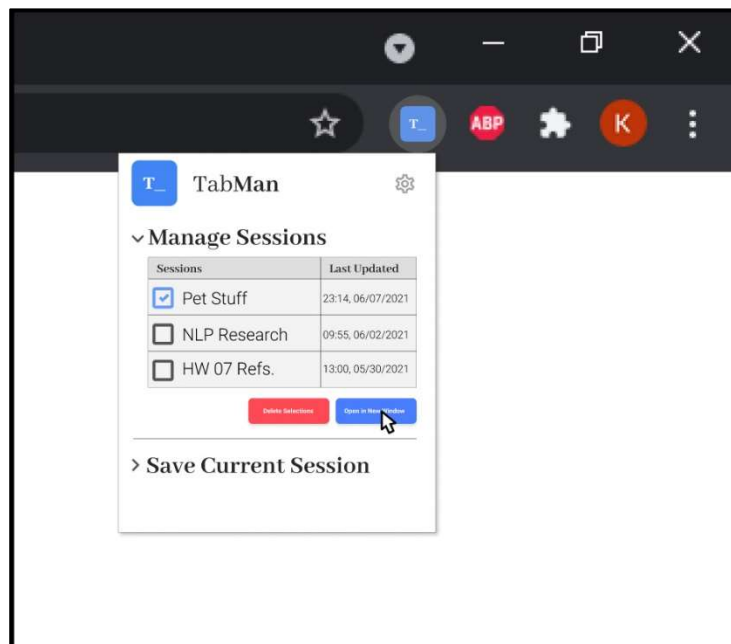

Loading a Session

To load a session, click on the Tabman logo and select **Manage Sessions**.

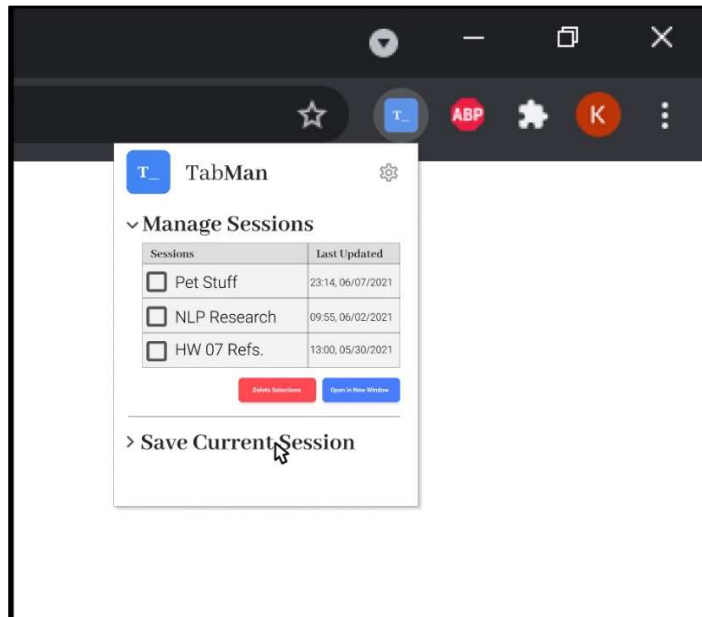

This will open up a new window with a list of all previously saved sessions. Select the associated checkbox for whichever sessions you would like to load. When finished, click on the blue button labelled **Open in a New Window**.

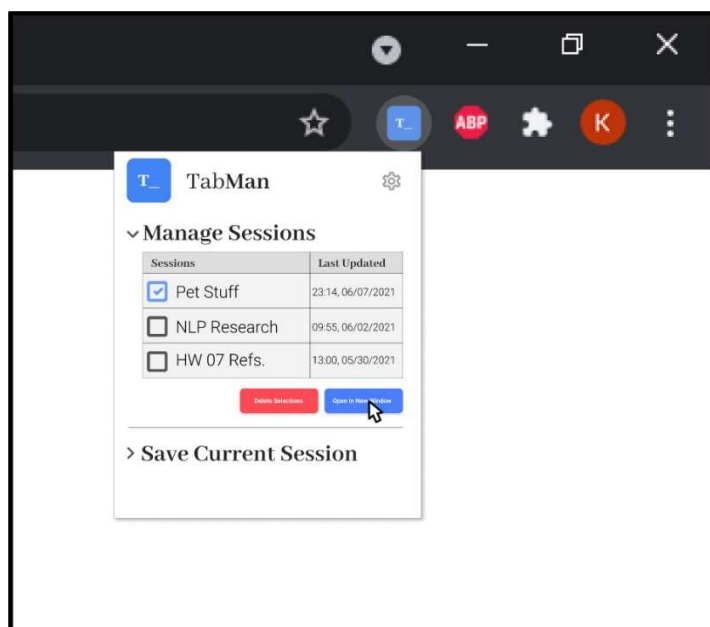

You may open a single or multiple sessions at a time. If you open multiple sessions, each session will be opened in a new browser window.

Updating a Session

To update the tabs or tab groups in a session, simply open the session and delete/add tabs in the browser. When finished, click on the Tabman logo to bring up the pop-up menu and select **Save Current Session**. A new window will appear showing the titles of all existing sessions.

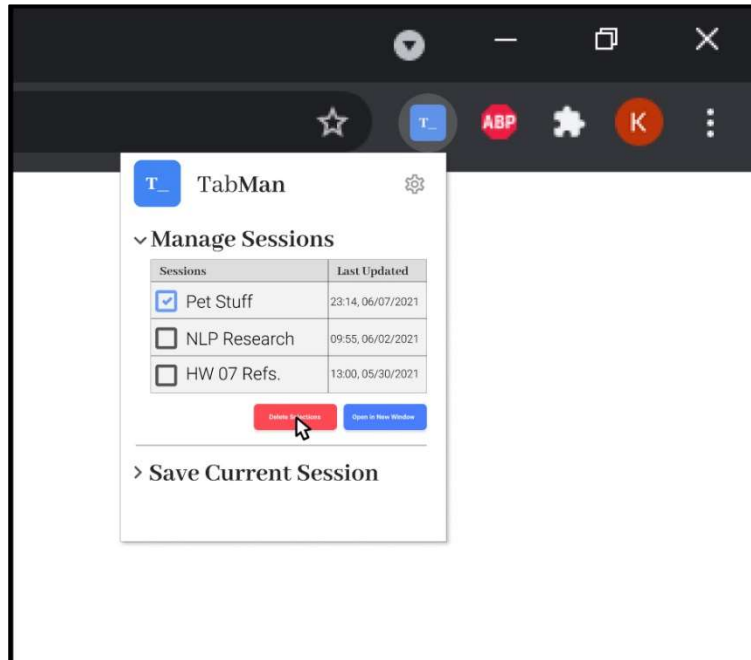

Click on the checkbox of whichever session you would like to update, then click on the blue button labelled **Overwrite**.

Note: Tabman does not currently implement version control for individual sessions. If you save over a session, it is not possible to retrieve it again.

Deleting a Session

To delete a session, click on the Tabman logo and click the checkbox of the session(s) you would like to delete. When finished, click on the **Delete Sessions** button.

A window will pop up showing you a list of all tabs and tab groups that will be deleted. Click the red button labelled **Delete Selections** again to confirm the deletions.
